

First Do No Harm: Suggestions Regarding Respectful Autism Language

Patrick Dwyer, MA,^{a,b} Jacalyn G Ryan, MA, CPA, CMA,^c Zachary J Williams, BS,^{d,e,f,g} Dena L Gassner, MSW^{h,i}

Nationally and internationally, efforts are ongoing to promote diversity, equity, and inclusion in healthcare and other fields. These efforts require consideration of ways in which language and assumptions impact individuals and communities. The autism and disability spheres are no exception. Indeed, the mental health of autistic people is predicted by the degree to which they feel society accepts them as autistic.¹ Thus, we believe discourse that disparages autism could be harmful to autistic people's well-being.² Autistic individuals who face further stigma and discrimination due to other intersectional identities might be particularly vulnerable.

Unfortunately, autism research and practice have traditionally used disparaging language grounded in the medical model.

Some might object that alternatives to traditional medical model terms are subjective or unscientific.³ However, we believe traditional terminology is heavily laden with subjective value judgements. For example, the traditional term "disorder" has a decidedly negative connotation. It also implies that individuals' own characteristics are responsible for their challenges, and it suggests a need to eliminate this disorder. In contrast, the more nuanced word "disability" allows both individual characteristics and societal or contextual barriers to

contribute to challenges. The term disability thus appears to be both more scientifically appropriate and less stigmatizing toward a vulnerable population than disorder.

In Table 1, which is adapted from work done by Bottema-Beutel et al,⁴ we list various traditional terms and concepts that many members of the autistic community believe are problematic, along with suggested replacements. We also suggest that practitioners and researchers balance a focus on autistic individuals' challenges with discussion of their strengths and potential. This balanced approach may be especially important for families of young children whose futures may be unclear and a source of considerable anxiety to caregivers.

TABLE 1 Traditional Terms, Concepts, and Ideas, Along With Suggested Alternatives.⁴

Traditional Terms, Concepts, and Ideas	Suggested Alternatives
Disorder	Disability ^{12,13}
Autism spectrum disorder	Autism, ¹⁴ autism spectrum development, ¹⁵ autism spectrum disability
Deficit	Area of challenge, difficulty ¹³
Autism symptoms	Autism characteristics, traits, features ⁴
Red flags for autism	Signs or indicators of possible autism
Problem behavior or challenging behavior	Distressed behavior, ¹⁶ meltdown, ^{4,17,18} more specific description of the behavior (e.g., self-injury, destruction of property) ⁴
Restricted interests	Focused, intense interests ^{4,19,20}
Comorbid	Co-occurring ^{4,21,22}
Risk ^a	Likelihood, probability ^{4,23}
Risk factor ^a	Predictive factor, predictor, correlate
Healthy controls	Typically-developing or neurotypical (if screened for other diagnoses), non-autistic (if only autism ruled out), or general population (autism not ruled out, group not sampled with regard to autism status) controls ⁴
High-functioning or low-functioning autism, severe autism or severity of autism	Descriptions of relevant individual characteristics (eg, autistic person with or without intellectual disability or language impairment) ^{24,25} Descriptions of support needs, grounded in specific contexts (as needs vary across contexts) ^{4,26}
Prevention of autism; treatments focused on reducing autism symptoms and on promoting recovery, normalization, and “optimal outcomes”	Interventions and supports aimed at curing or preventing co-occurring medical problems (not autism itself), ^{12,21} at teaching adaptive skills to individuals, ^{27,28} at making environments accessible, ^{28,29} and at promoting quality of life or well-being or thriving ^{4,21,28,29}
Rigid, inflexible	Consider: in any particular instance, is it the autistic individual, the environment around them, or both that is or are inflexible? ³⁰

^aOnly problematic when applied to autism; may be appropriate for many co-occurring conditions.

Furthermore, researchers and practitioners should be aware of an ongoing debate between supporters of identity-first (“autistic person”) and person-first (“person with autism”) language. Many autistic individuals support identity-first language^{5,6} and some fear that person-first language reflects negative attitudes toward autism.⁷ However, others endorse person-first language.^{5,6} The term “person on the autism spectrum” is often the most preferred term among autistic individuals and other stakeholder groups,^{5,6} and this verbiage is typically found to be acceptable by proponents of both person-first and identity-first language. Practitioners should ask about and respect the language preferences of individuals “on the spectrum” who can articulate their views.

Overall, in light of concerns that typically-developing people struggle to understand autistic perspectives,⁸ we urge practitioners and

researchers to strive to have empathy for how their language sounds to autistic people. We also suggest it can often be helpful to ask oneself if one would use similar phrasing with other marginalized communities. We feel that there needs to be a shift toward “cultural humility” and willingness to learn from autistic people about autistic identities and how to promote autistic well-being.

Practitioners and researchers interested in a more detailed discussions of appropriate autism terminology should refer to Bottema-Beutel and colleagues⁴ and Pia Bradshaw and colleagues.⁹ We provide definitions of neurodiversity terminology (eg, neurodiverse, neurodivergent) in Supplemental Table 2; we are indebted to Nick Walker’s prior work on that topic.^{10,11} The terminology ideas advanced here are a concise summary of ideas previously

proposed by many members of the autistic community and others in the autism and disability worlds.
